PERSONAL STATEMENT

Self taught software engineer looking to move from independent projects into structured, on the job learning through a Level 3 or 4 software development apprenticeship. I have built REST APIs, designed relational schemas, written tests and debugged production issues from first principles, without formal instruction, because I wanted to understand how real systems are built end to end. I am choosing an apprenticeship over a purely academic route because I learn fastest by building and want that building to happen inside a team, with real mentorship and real feedback, from day one. Practical experience in Java, Spring Boot and SQL, with genuine, validated use of AI assistance rather than blind trust in its output.

EDUCATION

Slough and Langley College <i>BTEC Extended Diploma in IT, grade D*DD (equivalent to A*AA)</i>	Sep 2024 to Jun 2026 <i>Slough, UK</i>
GCSE Equivalent (WAEC, Nigeria) <i>Mathematics (Grade 9 equivalent), English (Grade 5 equivalent), UK ENIC verified</i>	2022

TECHNICAL SKILLS

Languages: Java, TypeScript, JavaScript, SQL (PostgreSQL, SQLite), HTML/CSS
Frameworks: Spring Boot, Spring Security, Spring Data JPA, React, Vite, JUnit
Cloud & DevOps: AWS (ECS Fargate, ECR, RDS, S3, CloudWatch, IAM), Docker, GitHub Actions, Render, Vercel, Neon
Databases & Tools: PostgreSQL, Flyway, Hibernate, Maven, Git, Postman, DB Browser, Chart.js, Lombok

PROJECTS

McDonald's Clone <i>Java 21, Spring Boot, Spring Security, PostgreSQL, AWS, Docker</i> <i>Source: github.com/devMoxy/Mcd_Online_Ordering_System</i> - Designed a REST API and a schema of 5 tables for a food ordering system, with JWT auth, BCrypt hashing and access control enforced by user role across 8 endpoints. - Modelled order pricing as a business rule: line items snapshot menu price at purchase time, so later price changes cannot alter historical orders. - Enforced order status as a state machine on the server (PLACED to PREPARING to READY), rejecting transitions that violate the business logic. - Deployed with a staged Docker build across ECR, ECS Fargate, RDS PostgreSQL, S3 hosting and CloudWatch logs. - Replatformed to Fargate partway through the project after AWS closed App Runner, working from first principles to debug a stale image digest and a missing security group rule. - Traced a CORS bug invisible in Postman to a configuration bean never wired into the Spring Security filter chain, reproducible only from a real browser making cross origin requests.	2026
Moxy Football Quiz <i>Java 21, Spring Boot, React, TypeScript, PostgreSQL, Docker</i> <i>Live demo: football-quiz-frontend-ashen.vercel.app/</i> <i>Source: github.com/devMoxy/Football-Quiz</i> - Designed 18 REST endpoints and a schema of 7 tables for a football trivia platform with three modes, and 500+ curated questions. - Debugged a 27x production duplication bug from first principles, tracing row counts that divided evenly by 27 to a startup seeder that was not idempotent. - Built the frontend in React and TypeScript, including accessible keyboard navigation and lazy loaded images across an image heavy grid. - Set up GitHub Actions on both repos to run build and unit test checks on every push, catching regressions before they reached the live site.	2026

WORK EXPERIENCE

Data Engineering Extern

Jun 2026 to Aug 2026

Extern, in partnership with Breaking Games LLC (AdMagic)

Remote

- Owned the technical side of a business with no database and nobody who wrote SQL end to end: designed a relational schema from six unconnected raw files, adding keys to model the customer journey from ad click to purchase.
- Translated a vague business question into a ranked holiday reorder recommendation, based on revenue, across a catalogue of 117 products using joins, aggregations and subqueries.
- Collapsed 421 messy referral strings into a channel taxonomy, tying \$37k of Meta ad spend to \$61k of attributed revenue, quantifying return for a Q4 allocation plan.
- Investigated 1,000+ abandoned checkouts, isolating bot traffic behind a reusable view to recalculate the true rate.
- Used Claude to help write SQL queries, checking its output against the data before trusting a query or a number.
- Delivered a denormalised reporting table and a Chart.js dashboard, presented as the sole technical contributor and communicated clearly to stakeholders outside engineering.

Work Experience Placement (Scheduled)

12 to 14 Oct 2026

Opencast Software

In person

- Will gain exposure to Product Delivery, covering product management, business analysis and agile delivery practices.
- Will gain exposure to Software Delivery, covering development, QA and DevOps practices.
- Will gain exposure to User Centred Design, covering research, interaction, content and service design.
- Will take part in CV and interview workshops as part of the placement.

Crew Member

Mar 2024 to Present

McDonald's

Windsor, UK

- Served 200+ customers per shift in peak season at a busy site opposite Windsor Castle, against timed service targets.
- Trained 3 new crew members on till and kitchen procedures, including staff older and more experienced, giving and receiving feedback on performance.

VIRTUAL WORK EXPERIENCE

Software Engineering Virtual Experience

2026

Hewlett Packard Enterprise, via Forage

Remote

- Designed and deployed a RESTful web service in Java Spring Boot on the HPE GreenLake edge to cloud platform.
- Built backend structures to support secure data upload, handling JSON payloads and core HTTP methods.
- Wrote unit tests using automated test frameworks to verify API endpoint functionality and system stability.

Junior Developer Virtual Experience

2026

Barclays, via Springpod

Remote

- Chose a database type and designed tables for an internal to do list application, assigning appropriate data types to each field.
- Mentored by video by a Barclays employee, then compared own database design against a model answer to identify gaps in approach.

Cloud Computing Virtual Experience

2026

Amazon Future Engineer, via Springpod

Remote

- Researched how Snap used AWS to support a digital product used by millions, then developed a persuasive client pitch translating the technical benefits of cloud migration into business focused language.
- Benchmarked own pitch against a model answer, reflecting on structure and identifying how to strengthen the argument.
