PERSONAL STATEMENT

Motivated and self-taught developer from Maidenhead with a Level 3 BTEC Extended Diploma in IT (D*DD). I have built two full stack applications, a food ordering system and a football quiz, using Java, Spring Boot, SQL and React, and gained workplace experience through a placement at Opencast Software and a data engineering externship. Working part time at McDonald's has developed my communication, teamwork and ability to stay calm under pressure. I am seeking a Level 3 or 4 software development apprenticeship where I can learn from experienced engineers and contribute to real projects.

EDUCATION

Slough and Langley College Sep 2024 to Jun 2026
*BTEC Extended Diploma in IT, achieved grade D*DD (equivalent to A*AA)* *Slough, UK*

GCSE Equivalent (WAEC, Nigeria) 2022
Mathematics (Grade 9 equivalent), English (Grade 5 equivalent), UK ENIC verified

TECHNICAL SKILLS

Languages: Python, Java, TypeScript, JavaScript, SQL (PostgreSQL, SQLite), HTML/CSS
Frameworks: Spring Boot, Spring Security, Spring Data JPA, React, Vite, JUnit
Cloud & DevOps: AWS (ECS Fargate, ECR, RDS, S3, CloudWatch, IAM), Docker, GitHub Actions, Render, Vercel, Neon
Databases & Tools: PostgreSQL, Flyway, Hibernate, Maven, Git, Postman, DB Browser, Chart.js, Lombok

PROJECTS

McDonald's Clone 2026
Java 21, Spring Boot, Spring Security, PostgreSQL, AWS, Docker
Source: github.com/devMoxy/Mcd_Online_Ordering_System

- Built a full stack food ordering system: a Spring Boot REST API with JWT authentication, BCrypt password hashing and role based access control, backed by a 5 table PostgreSQL schema and 8 endpoints.
- When AWS closed App Runner to new customers mid project, I replatformed to ECS Fargate myself, debugging a stale container image and a missing security group rule from the CloudWatch logs until it ran.
- Stored a price snapshot on each order line item, so historical orders are unaffected by later menu price changes.
- Enforced order status as a server side state machine (PLACED, PREPARING, READY) and deployed with a multi stage Docker build to AWS (ECR, ECS Fargate, RDS PostgreSQL).
- Traced a CORS failure that was invisible in Postman to a configuration bean never wired into the Spring Security filter chain, and learned to test in a real browser, not just the convenient tool.

Moxy Football Quiz 2026
Java 21, Spring Boot, React, TypeScript, PostgreSQL, Docker
Live demo: football-quiz-frontend-ashen.vercel.app/
Source: github.com/devMoxy/Football-Quiz

- Built a full stack football quiz with three game modes and 500+ questions: a React/TypeScript frontend, a Spring Boot REST API with 18 endpoints and a 7 table PostgreSQL schema.
- Diagnosed a 27x data duplication bug in production after noticing every row count divided evenly by 27, and traced it to a startup seeder that was not idempotent.
- Built a custom ARIA combobox with full keyboard navigation for the answer input, and added lazy loading for images to reduce page weight.
- Added an API key check after finding open content mutation endpoints, and set up GitHub Actions on both repos to run build and test checks on every push.
- Found two independently shuffled lists were still positionally correlated because they were built in lockstep, and validated the fix with a 200 trial statistical regression test, learning that working once is not proof.

WORK EXPERIENCE

Data Engineering Extern Jun 2026 to Aug 2026
Extern, in partnership with Breaking Games LLC (AdMagic) *Remote*

- Corrected a reported 91% cart abandonment rate to 50.8% by aligning mismatched date windows and removing 28 bot pattern carts, verifying the figure two independent ways before reporting it.
- Presented my final data and a Q4 reorder and ad reallocation plan to non-technical staff at Breaking Games and to the CEO of AdMagic, learning to explain results in plain language.
- Designed a dimensional database with fact and dimension tables to connect six unlinked data sources, wrote SQL using JOINs, GROUP BY, CTEs, views and window functions, and built a Chart.js dashboard showing five KPIs and a product leaderboard.
- Found that Paid Social, which took most of the $37,201 Meta budget, converted at 0.124% against 0.476% for free organic search, after sorting 421 inconsistent referral labels into clear channels.

Work Experience Placement 12 to 14 Oct 2026
Opencast Software *Newcastle*

- Pair programmed on a Raspberry Pi for a Robot racing project, writing a Python race timer with a partner and fixing issues together.
- Proposed an accessible gaming website concept using the JavaScript Web Speech API for text to speech and 3D character previews and presented it to consultants with 10+ years of industry experience, receiving positive feedback.
- Built Lego models as a team using waterfall, agile and kanban, and saw how each methodology has its edge on different kinds of projects.
- Completed a 3 day placement across product delivery, user centred design and software delivery, including an agile ways of working session and product management and business analysis workshops, collaborating in teams to solve problems.

Crew Member Mar 2024 to Present
McDonald's *Windsor, UK*

- Serve 200+ customers per shift in peak season at a site opposite Windsor Castle, working to timed service targets.
- Trained 3 new crew members, including colleagues older and more experienced than me, and learned to give feedback respectfully.
- Have worked here alongside college and my own software projects, which taught me to manage my time and turn up reliably.

VIRTUAL WORK EXPERIENCE

Software Engineering Virtual Experience 2026
Hewlett Packard Enterprise, via Forage *Remote*

- Built a RESTful web service in Java Spring Boot that accepts JSON payloads over HTTP.
- Wrote a short proposal explaining what I planned to build before writing any code.
- Wrote automated unit tests to verify the endpoints behaved correctly.

Junior Developer Virtual Experience 2026
Barclays, via Springpod *Remote*

- Chose a database type for an internal to do list tool and justified the choice, then designed the table schema and assigned a data type to each column.
- Compared my design with a model answer after video mentoring from a Barclays developer, spotting where my thinking differed and improving it.

Cloud Computing Virtual Experience 2026
Amazon Future Engineer, via Springpod *Remote*

- Researched how Snapchat uses AWS to serve a product used by millions of people.
- Wrote a client pitch on AWS cloud migration, covering demand, reliability and growth in plain business language, then compared it with a model answer and found ways to strengthen it.
